

Description

Organic coolant liquid recommended for all types of cooling circuits, including aluminium circuits. Prevents mechanical breakdowns caused by high temperatures by dissipating heat or freezing the coolant liquid. Contains specific additives that prevent corrosion and build up of deposits in the system.

Properties

- Prevents foam formation.
- Guarantees excellent heat transfer.
- Prevents formation of deposits and sludge in the cooling circuit.
- Has alkaline capability to neutralise combustion acidic gases that inevitably pass through the cooling circuit.
- Compatible with joint and seals, avoiding the risk of fluid loss.
- Prevents cavitation, corrosion, and overheating of the engine.

Quality levels, approvals and recommendations

- ASTM D3306
- BS 6580
- UNE 26-361-88

Technical specifications

	UNIT	METHOD	VALUE
Colour	-	Visual	Pink
Density at 20 °C	g/cm3	DIN 51757-4	1.07
Freezing point (at 50%)	°C	ASTM D1177	-38

The above mentioned characteristics are typical values and should not be considered product specifications.
